

## ROCOL<sup>®</sup> Safety Policy Statement

ROCOL handles a wide range of materials, including chemicals, during the manufacture and supply of its products. Risk assessment has identified flammability and chemical handling as the major hazards associated with these processes.

ROCOL recognises and accepts its responsibility to provide, maintain and promote safe and healthy working conditions, equipment and systems of work for all employees, visitors and contractors. Further, ROCOL is committed to the prevention of injury and ill health for all employees, visitors and contractors.

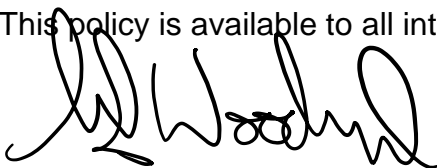

By operating a Safety Management System complying with ISO 45001 ROCOL will review its performance and set objectives and targets in line with current risk assessments, new legislation and technology, with a view to continually improving safety performance.

ROCOL will comply with all applicable safety legislation, codes of practice and other applicable requirements.

ROCOL will provide such information, training and supervision as is needed to meet these requirements using, where appropriate, specialist external skills.

This policy is documented, implemented, maintained and communicated to employees through the safety management system; and employees can actively contribute to the system through safety committees and hazard identification, risk assessments and the application and maintenance of risk controls. While all employees have a duty to work safely, specific responsibilities relating to the implementation of this policy are included in the Safety and Environment Manual.

This policy is available to all interested parties, on request, including the public.
